

# airdot<sup>®</sup>

Zone heat recovery unit

Maximum capacity of **60m<sup>3</sup>/h** | Heat recovery up to **92%** | Silent operation from **16dB(A)** | Max power consumption of **6.7W** | Alternating cooperation up to **16** units

**Dimensions**

# Alternating units operation

1<sup>st</sup> cycle

Extraction of warm, stale air. Heat accumulation in the exchanger.

2<sup>nd</sup> cycle

Fresh air supply. Collection of accumulated heat.

# Why choose ventilation with airdot®?

- Without ventilation moisture accumulates, which is dangerous to health and the buildings. The recuperator ensures mandatory, **continuous air exchange**, preventing the situation of exceeding the set humidity threshold.
- The energy-saving motor, high heat recovery and advanced controls translate into a **high energy class A**, which helps you save money.
- The division of the system into zones together with the use of integrated humidity and dusk sensors allow for **ventilation adapted to the local needs** of the user.
- The **airdot®** units, creating an intelligent system, are used both in **newly designed and existing buildings**, in particular those that have undergone thermomodernization.
- The use of **airdot®** helps to **reduce the building's annual demand for non-renewable primary energy (PE)**, which is part of the European Union's policy aimed at reducing the energy consumption of buildings.
- Quick installation** in the external wall of the building, without the need to construct a complicated installation increasing the cost and negatively affecting the cubic capacity of the rooms and their architecture.
- Reusable filters, low electricity consumption and efficient heat recovery guarantee **comfort and low operation costs**.
- The choice of the direction of air flow in the ventilated spaces prevents the spread of nuisance odours and, on summer days, enables the **freecooling** function.

# What is worth knowing about **airdot**®?

The **airdot**® heat recovery unit, compared to central ventilation, does not require wiring. This facilitates installation and does not affect the interior design of both new and modernized buildings. Combining the units in **airdot**® link or link+ makes it possible to build an intelligent ventilation system for the entire living space. Depending on the version, communication between devices is carried out by wire (link) or wirelessly using a radio signal (link+).

**strongair**® solutions

Well-thought-out, easy to assemble, advanced design. The IPX4 degree of protection shields the device against atmospheric conditions.

Made of the highest quality ABS material ensures durability and elegant design.

Advanced automation adjusts the operation to the demand and combines the units into one efficient ventilation system.

Installation with a slope "to the outside" eliminates the need to lead the condensate to the sewage system.

Placing the reversible fan behind the exchanger ensures reduction of noise emitted to the ventilated room.

An energy-saving EC motor and an elongated heat exchanger combined with intelligent control translates into a high energy class of the device.

Automatic restart after a power failure allows you to forget about operating the device.

**AUTO RESTART**

No negative impact on human health and the natural environment confirmed by the Polish National Institute of Hygiene.

# airdot® easy basic version

- Designed for **stand-alone operation**
- Cyclic supply/extract operation
- Ability to operate at I/II gear
- On/off switch and gear selection located on the housing of the device
- Standard wall switch can be used for unit control

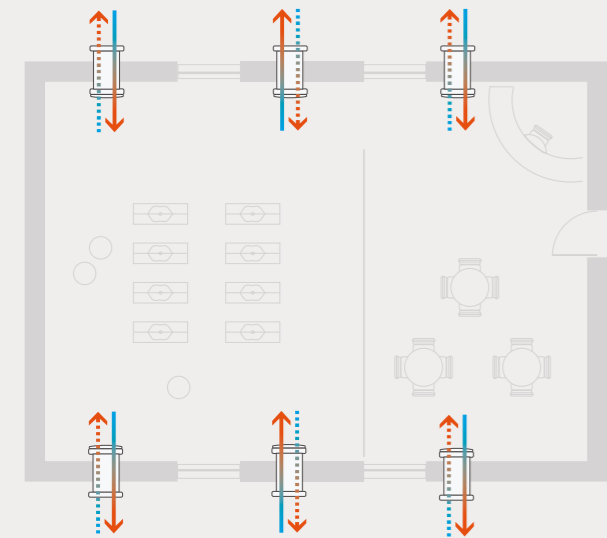

**1 airdot® recuperator**  
Alternating independent operation

# airdot® link wired version

Thanks to mutual wired communication, the recuperators synchronize the air supply and extraction.

- **Wired communication** up to 16 units
- Alternating operation of cooperating devices
- 1 remote control with LCD display for the entire system
- Integrated humidity and dusk sensors
- Multifunctional controls
- Ability to operate at: night mode/I/II/III gear

up to **16** airdot® recuperators  
Alternating operation up to 16 units

■ **Wired communication**

# airdot® link+ wireless version

Thanks to mutual wireless communication, the recuperators synchronize the air supply and extraction.

- **Wireless communication** up to 16 devices
- Alternating operation of cooperating devices
- 1 remote control with LCD display for the entire system
- Integrated humidity and dusk sensors
- Multifunctional controls
- Ability to operate at: night mode/I/II/III gear

up to **16** airdot® recuperators  
Alternating operation up to 16 units

■ **Wireless communication**

# Control

Remote control for **airdot**® link, link+ versions

**FAN**  
Fan speed adjustment in manual mode  
60 m³/h, 40 m³/h, 20 m³/h.

**AUTO MODE**  
**AUTO**  
**airdot**® adjusts the ventilation to the set humidity level in the room and activates the night mode based on the signal from the built-in dusk sensor.

**NIGHT MODE**  
The heat recovery unit operates at the lowest speed, reducing the noise level of the fan to a minimum.

**AIRFLOW**  
Switching between air flow directions: MASTER-SLAVE flow, SLAVE-MASTER flow, EXTRACT, SUPPLY.

**RESET FILTER**  
**FILTER CLEANING RESET**  
Deactivation of the filter alarm after the filter was cleaned or replaced.

**HUMIDITY**  
Selectable level of required humidity: 90/60/40%. When the humidity in the room exceeds the set threshold, all devices of the system work in the air extraction mode.

**MANUAL MODE**  
**MANUAL**  
The device works with heat recovery. The user can select the desired fan speed.

**STANDBY MODE**  
The recuperator is in standby mode with the outlet flap closed. When it detects too much humidity in the room, it automatically turns on in the extraction mode. After the parameters are equalized, it returns to the standby mode.

**BOOST MODE**  
The device extracts air from the room at maximum capacity for 20 minutes.

# Quick installation

Materials and tools

Installation

- Drill holes in the wall using the supplied template.
  - Insert the mounting pins.
- Cut the tube to size, insert it into the hole.
  - Fill the space with mounting foam.
  - Connect the power (2-wire) and control (3-wire) cables.
- Mount the **airdot**® front panel.
  - Analogous procedure with the external element.
- Route and connect the power and control cables.
  - Lock them with a bracket and install end caps.
- Install the main module with fan and heat exchanger.
  - Connect the plug of the fan to the control board and configure the device.
- Lock the module and close the control cover as well as front panel.
  - airdot**® is ready for operation.
